

Project Initialization and Planning Phase

Date	15 March 2024
Team ID	
Project Title	Credit Card Approval Prediction
Maximum Marks	2 Marks

Project Proposal (Proposed Solution) report

S.No.	Parameter	Description
1	Problem Statement (Problem to be solved)	Banks receive thousands of credit card applications every day. Manual verification is time-consuming, prone to human error, and often delays approval decisions.
2	Idea / Solution Description	Develop a Machine Learning-based Credit Card Approval Prediction System using Python, Flask, Scikit-learn, and XGBoost. The system analyzes applicant information such as income, employment status, education, and credit history to instantly predict whether a credit card application is likely to be approved or rejected.
3	Novelty / Uniqueness	The solution combines multiple machine learning algorithms to improve prediction accuracy and provides real-time approval predictions through a simple web application.
4	Social Impact / Customer Satisfaction	The solution can be offered as a Software-as-a-Service (SaaS) platform to banks and financial institutions through subscription or licensing. It can also be customized and integrated into existing banking systems.
5	Scalability of the Solution	The system can support large numbers of users and applications. It can be deployed on cloud platforms such as IBM Cloud and expanded with new datasets and machine learning models to improve prediction accuracy over time.
